

CP/M with the MEMON PROM Monitor

This folder contains versions of CP/M for computers using the MEMON PROM monitor to manage the system's serial ports (e.g., the console port and the secondary "transfer" port). For a given floppy disk controller, the same version of CP/M will work across multiple machines as long as the MEMON PROM is present.

Utilities to create and archive disks (PC2FLOP and FLOP2PC) are provided as well as file transfer utilities (PCGET and PCPUT) to transfer individual files between CP/M and a PC.

To support operation as described, MEMON must be version 3.04 or newer and the base address for MEMON (MEBASE) must be F800h.
