

Looking down on the header on the PCB  
or down into the wire side of the plug.

When installed in a Minidisk cabinet, the Minidisk buffer board obtains power from a center—tapped 28 vac transformer (pins 1 & 5, pin 3 is center tap).

When used in the Foley configuration inside an 8800bt, the transformer secondary is 40 vac and the heat that must be dissipated by the buffer board regulators becomes excessive. Instead, the buffer board can be powered the from 8800bt's DC supplies as shown above.
