NOTES:

1. FOR DRAWING INDEX LIST REFER TO DWG D-DI-PA63-Ø-1.
2. FOR PWR WIRING REFER TO DWG C-IC-PA63-Ø-1G.
3. IF FANS SUPPLIED ARE DEC # 12050B3-02(BOXER) MTG HDWR REQ'D IS ITEM #42 (SELF TAPPING SCR) ONLY.
   IF FANS ARE DEC #12050B3-01 (ROTRON) MTG HDWR REQ'D IS ITEM #23 (SCR) & #24 (MTG CLIP).
4. ~~REMOVE EXISTING PLATE FROM POWER SUPPLY & REPLACE WITH ITEM #9, USING EXISTING HDWR, BEFORE ASSEMBLING IN CHASSIS.~~
5. NOTE 798 OR H721 P/S CANNOT MOUNT BEHIND PA63 UNIT. MUST BE MTG'ED ABOVE OR BELOW UNIT ON REAR DOOR OF CAB AS SHOWN.
6. ~~TERMINATE C2CT2 THRU C5CT2 AS SHOWN BELOW, 16 PLACES.~~
7. AIR FLOW SHOULD BE FLOWING INTO CHASSIS
8. AC POWER TO FANS WILL HAVE TO BE TAKEN FROM CABINET AC BUSSES TABS PER C-IC-PA63-Ø-1G
9. ITEM 70 (.1 UFD, 100V, CAP) WHICH GOES FROM A28 B1 TO GND MUST BE COMPLETLY INSULATED WITH TUBING ON ITS LEADS & TERMI-POINT CONNECTORS.
10. RESISTOR TO BE MOUNTED BELOW THE TRANSFORMERS AND SECURED TO THE 6-32 RIVNUT INCORPORATED IN THE BASEPLATE. CENTER RESISTOR BETWEEN THE TRANSFORMERS.

This drawing and specifications, herein, are the property of Digital Equipment Corporation and shall not be reproduced or copied or used in whole or in part as the basis for the manufacture or sale of items without written permission.

NOTES.

1. ALL WIRE TO BE #18 AWG UNLESS OTHERWISE SPECIFIED.

* APPLY HY-SHRINK TUBING PLACED AS SHOWN.

2. THE PA63, H721, AND 798 MUST ALL BE WIRED TO GROUND. GROUND BEING THE 'GREEN' (SAFETY GROUND) CONDUCTOR ON THE AC POWER CORD.

3. *IF MORE THAN 6 PR68D (DA) READERS APPEAR ON SYSTEM. AN ADDITIONAL 798 P.S. MUST BE ADDED TO SUPPLY -15V. IF THIS IS DONE, THE H721 CANNOT BE USED TO SUPPLY -15V AT THE SAME TIME.*

4. *ON 50 HZ SYSTEMS, AN 798A P.S. MUST REPLACE THE 798 P.S.*

SHEET ____ OF ____

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PA63

I. Description

The PA63 is a controller for; up to 16 PR68D paper tape readers and up to 16 PP67C or PP67D paper tape punches. It can interface to any one of the positive bus family of PDP-8 computers. One reader and one punch can be selected at a time. The punch section controls the turning on and turning off of the selected punch motor; it also controls the solenoids which determine the bits to be punched. The reader section controls the selected stepping motor; it also buffers the data bits after it commands the selected reader to fetch a character.

II. General Specifications

A. Mechanical Packaging

The PA63 consists of a standard H925 module drawer with 36 H803 mounting blocks. The drawer is mounted using chassis tracks.

B. Environmental Specifications

The PA63 will operate at a temperature range of 20°C to 50°C.

The power required is supplied by an H721 power supply for +5v and -15v and a DEC 793 power supply for +30v.

C. Programming Specifications

Instructions

Punch	PSF	6021	Skip if punch flag = 1
	PCF	6022	Clear flag and punch buffer
	PPC	6024	Load buffer and punch
	PLS	6026	Clear flag and buffer; load and punch.
Reader	RSF	6011	Skip if reader flag = 1
	RRB	6012	Read reader buffer, and clear flag
	RFC	6014	Clear flag and buffer and fetch character.

	SIZE	CODE	NUMBER	REV

SHEET 2 OF 6

Instructions (Continued)

General		6311	Skip if punch not ready
		6312	Select reader
		6314	Select punch

Programming Examples

Reader	7604	LAS	(Octal Code SR_{8-11} for
	6312	SEL Rdr	reader to be sel)
	7300	CLA CLL	
SR=7000	6014	RFC	
Load Address	6011	RSF	
SR_{8-11} = Reader Number	5204	Jmp .-1	
	6012	RRB	
START	5202	Jmp .-5	

This program will command the selected reader to read the paper tape which is placed in its tape path guide.

Punch	7604	LAS	(Oct. Code SR_{8-11} for punch
	6314	Sel Punch	to be selected)
	6311		Skip if punch not available
	7410	SKP	
	7402	HLT	
	7300	CLA CLL	
SR=7000	7040	CMA	
Load Address	6026	PLS	
SR_{8-11}=Punch Number	6021	PSF	
	5210	JMP.-1	
START	5206	JMP.-4	

The program will command the selected punch to punch a continuous pattern of one's and zero's.

III. System Components

A. Modules - See print UML PA63
B. Cables - 1) Standard applicable I/O cables
2) One BCØ1H-0-0 cable per reader
One BCØ1F-0-0 cable per punch
C. Power Supplies: DEC 778
H720(C)

IV. Interface Specifications

A. The I/O signals are detailed in the PDP-8 Small Computer Handbook.
B. Reader Signals

Pin	Signal	Description
P1,B2	-15v	Supplies current to reader amplifiers and bulbs
R1,A2	+5v	Supplies current to all logic components
S1,U1,U2	+30v	Supplies current to drive stepping motor
V1	Sel.Rdr	When signal is asserted, reader is selected.
C2,T1	GND	
D2	Hole ØØ (H)	Signal is asserted when a hole is detected.
E2	Hole Ø1 (H)	Signal is asserted when a hole is detected.
F2	Hole Ø2 (H)	Signal is asserted when a hole is detected.
H2	FH(H)	Signal is asserted when a hole is detected. Used to detect out of tape.
J2	Hole Ø3 (H)	Signal is asserted when a hole is detected.
K2	Hole Ø4 (H)	Signal is asserted when a hole is detected.
L2	Hole Ø5 (H)	Signal is asserted when a hole is detected.
M2	Hole Ø6 (H)	Signal is asserted when a hole is detected.
N2	Hole Ø7 (H)	Signal is asserted when a hole is detected.
T2	BØØL	+30v to GND. Used to increment motor.

B. Reader Signals (Continued)

Pin	Signal	Description
S2	BØ1L	+30v to GND. Used to increment motor.
R2	AØØL	+30v to GND. Used to increment motor.
P2	AØ1L	+30v to GND. Used to increment motor.
V2	NTTA	When signal is at GND, it places the readers in the non-torn tape allotment mode.

C. Punch Signals

N1,P1,R1,S1 U1,V1	+30v	Supplies current to solenoids
T1,C2	GND	
A2,V2	+5v	Supplies voltage to control circuitry
D2	P Hole ØØ(L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
E2	P Hole Ø1(L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
F2	P Hole Ø2(L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
H2	P Feed Hole (L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state. This signal should be set to a 4.5ms positive width.
J2	P Hole Ø3 (L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
K2	P Hole Ø4 (L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
L2	P Hole Ø5 (L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.

C. Punch Signals (Continued)

M2	P Hole Ø6 (L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
N2	P Hole Ø7 (L)	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
P2	MS(L)	When signal is at GND, the selected punch motor will start.
R2	AVAIL (L)	When signal is at GND, the selected punch is available.
T2	½ Sync (H)	A signal supplied from the punch to sync the strobing (feed hole) pulse.

V. Checkout Specifications

See A-SP-PA63-Ø-21 and A-SP-PA63-Ø-22

VI. Acceptance Procedures

See A-SP-PA63-Ø-19

VII. Engineering Drawings

See A-ML-PA63-Ø

DEC FORM NO. DRA 107

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PA63 ACCEPTANCE CRITERIA - FIELD ONLY

SCOPE - To define the criteria necessary to accept the positive bus PA63 16 channel reader/punch multiplexer. This criteria assumes that:

a. The PA63, if an add-on, has been connected into the system, and

b. All preceding diagnostics for the computer and any other peripherals; DF32, DECtape, etc., have been run successfully.

c. The user is familiar with the operation of the Typeset-8 Systems Exerciser (TCSE). Reference document Maindec-08-07AO-D which should be available at all local Field Service Offices.

PRELIMINARY

Before checking out the PA63, make sure that all readers and punches are aligned correctly (refer to alignment procedures for PR68B/D/DA readers and PP67C/D punches).

NOTE: Use the customers tape for these tests if it falls within specs. Refer to the Typeset-8 System Users Guide (DEC-08-HGZA-D) SECTION 3.5 for paper tape specifications.

Check that the reader clock M401 location A15 pin D2 is set at 2.3 ms exactly. Check that the punch done level M710 location AB30 pin BH2 has a positive delay of 4.5 ms exactly.

PROCEDURE

I System without NTTA Option

a. Make sure the NTTA switch in the PA63 is in the OFF position.

b. Load a full roll of paper tape (as used by the customer for his keyboads) in each punch.

c. Load the customized version of the system exerciser (supplied with each system), overlay 3.

	SIZE	CODE	NUMBER	REV
	A	SP	PA63-0-23	

DEC FORM NO 15-1022

PROCEDURE (continued)

I d. Commence punching out the test pattern on all punches using Segment 1 of Overlay 3. After two or three passes, as each punch is punching its test (special binary count) pattern, turn the punch to the STOP WHEN DONE position. The punch should continue to the end of the test pattern. Make sure that the message "EDV3S1 PUNCH XX NOT AVAILABLE" is typed out for each punch as each punch is again checked and found to be unavailable. Discontinue running of segment 1.

e. Make a loop of each tape generated in step d and load in each reader, placing all reader switches in the ON position. Commence reading using Segment 0 of overlay 3. After two or three passes, as each reader finishes reading the test pattern, place the reader switch in the OFF position. Make sure that the message "EOV3S0 RDR XX NO RESPONSE" is typed out for each reader as each reader is again checked and found to be unavailable. Discontinue running of segment 0, and remove the tape loops. Recommence running of segment 0 with all reader switches in the ON position but no tape in the readers. The same error messages should again be typed out.

f. Run all segments of Overlay 3 until the tape in each punch has been expended. There should be no errors in reading or punching for a full roll of tape, excluding those due to tape skewing or dirt picked up off the floor, etc.

Since the punch segment runs faster than the reader segment, large amounts of tape tend to pile up in the buffer area between the reader and the punch. This buffer area is usually the floor and gives trouble in tape skewing and dirt pick-up. An acceptable alternative to feeding the tape direct from the punch to the reader is to run the reader segment using the tape loops generated in step e). However, when punching is finished, the tapes punched out by segment 1 must be verified by the readers; running all segments but segment 1 of overlay 3.

PROCEDURE (continued)

II System with NTTA option

In addition to steps a) through f) in the preceding section, perform the following:

a. Throw the NTTA switch in the PA63 to the ON position.

b. Place a tape loop in each reader and press the reader switches. Observe that the "available" light in each reader is extinguished. Run segment 0, noting that after a test pattern has been tested in a reader, the "available" lamp will be lit again. Press the switch again on each reader after this occurs. After running for three or four passes do not press the reader switches anymore, noting that as each reader is checked again and found to be unavailable, the message "EOV3S0 RDR XX NO RESPONSE" is typed out. Discontinue running segment 0.

NOTE 1

If mixed input levels are to be used by the customer, when the PA63 has been checked out, the switch in the PA63 must be left in the 8 level position.

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PA68F

I. Description

The PA68F is a controller for a PR68DA paper tape reader and PP67C or PP67D paper tape punch. It can interface to any one of the positive bus family of PDP-8 computers. The punch section controls the turning on and turning off of the punch motor; it also controls the solenoids which determine the bits to be punched. The reader section controls the stepping motor; it also buffers the data bits after it commands the reader to fetch a character.

II. General Specifications

A. Mechanical Packaging

The PA68F consists of an H911 mounting panel with six instead of eight H803 mounting blocks. An H716 power supply is mounted on the H911 in the slot where the two mounting blocks were removed.

B. Environmental Specifications

The PA68F will operate at a temperature range of 20°C to 50°C. The power required is supplied by an H716 power supply (+5v and -15v) and a DEC 799 power supply (+30v).

III. Programming Specs

Punch Programming Instructions

PSF	6021	Skip if punch flag = 1
PCF	6022	Clear flag and punch buffer
PPC	6024	Load buffer and punch
PLS	6026	Clear flag and buffer, load and punch
	6311	SKIP IF PUNCH NOT AVAILABLE

Reader Programming Instructions

RSF	6011	Skip if reader flag = 1
RRB	6012	Read reader buffer and clear flag
RFC	6014	Clear flag and buffer and fetch character.

SIZE	CODE	NUMBER	REV
A	SP	PA68-F-9	C

DEC FORM NO DRA 108

III. Programming Specs (Continued)

Programming Examples

Reader		7000/7300	CLA CLL
		6014	RFC
SR=7000		6011	RSF
L.A.		5202	JMP .-1
START		6012	RRB
		5200	JMP .-5

This program will command the reader to read the paper tape which is placed in its tape path guide.

PUNCH	7000/7300	CLA CLL		
	6311	CHK AVAIL	7040	CMA
	7410	SKP	6026	PLS
	7402	HLT	6021	PSF
			5206	JMP.-1
			5201	JMP.-7

This program will command the punch to punch a continuous pattern of one's and zero's.

IV. Systems Components

A. Modules - See Print UML-PA68F
B. Cables - 1) Standard applicable I/O cables
2) One BC01H-Ø-Ø (reader) cable
One BC01F-Ø-Ø (punch) cable
C. Power Supplies - DEC 799
H716

V. Interface Specifications

A. The I/O signals are detailed in the PDP-8 Small Computer Handbook.
B. Reader Signals

Pin	Signal	Description
P1,B2	-15v	Supplies current to reader amplifiers and bulbs.
R1,A2	+5v	Supplies current to all logic components

Reader Signals (Continued)

Pin	Signal	Description
S1,U1,U2	+30v	Supplies current to drive stepping motor
V1	Sel.Rdr H	When signal is asserted, WHEN reader is ENABLED BY ROCKER SWITCH.
C2,T1	GND	
D2	RD Hole Ø H	Signal is asserted when a hole is detected.
E2	RD Hole 1 H	Signal is asserted when a hole is detected.
F2	RD Hole 2 H	Signal is asserted when a hole is detected.
H2	OUT OF TAPE H	Signal is asserted when a hole is detected. Used to detect out of tape.
J2	RD Hole 3 H	Signal is asserted when a hole is detected.
K2	RD Hole 4 H	Signal is asserted when a hole is detected.
L2	RD Hole 5 H	Signal is asserted when a hole is detected.
M2	RD Hole 6 H	Signal is asserted when a hole is detected.
N2	RD Hole 7 H	Signal is asserted when a hole is detected.
T2	SDB (Ø) L	+30v to GND. Used to increment motor.
S2	SDB (1) L	+30v to GND. Used to increment motor.
R2	SDA (Ø) L	+30v to GND. Used to increment motor.
P2	SDA (1) L	+30v to GND. Used to increment motor.
V2	NTTA	Not Applicable

Punch Signals

Pin	Signal		Description
N1,P1,R1,S1,U1,V1	+30v		Supplies current to solenoids
T1,C2	GND		
A2,V2	+5v		Supplies voltage to control circuitry
D2	Hole Ø0	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
E2	Hole Ø1	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
F2	Hole Ø2	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
H2	Feed Hole	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state. This signal should be set to a 4.5ms positive width.
J2	Hole Ø3	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
K2	Hole Ø4	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
L2	Hole Ø5	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
M2	Hole Ø6	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
N2	Hole Ø7	L	When signal is at GND, the appropriate solenoid will be in a "Hole" state.
P2	MOTOR START	L	When signal is at GND the selected punch motor will start.
R2	NOT AVAIL	H	WHEN PUNCH IS OUTPUT
T2	SYNC H PUNCH	H	A signal supplied from the punch to sync the strobing (feed hole) pulse.

VI. Acceptance Procedures

See A-SP-PA68F-8

ENG	APPD	SIZE	CODE	NUMBER	REV
		A	SP	PA68 - F - 11	

DEC FORM NO. DRA 107

ENGINEERING SPECIFICATION [redacted] CONTINUATION SHEET

TITLE PA68F ACCEPTANCE CRITERIA - FIELD

I SCOPE

A. To define the criteria necessary to field accept the positive bus PA68F, single channel reader/punch control.

II FIELD ACCEPTANCE

A. Shipping Software

1. Prints - all on A-ML-PA68F
2. Diagnostics

a. MAINDEC-08-D2HC (Family of 8 tests for type-setting)

b. System Exerciser (two copies of customized version)

B. Shipping Hardware

1. PA68F logic with all necessary modules and I/O cables
2. Reader/punch cables as per construction requisition (or key sheet)

C. Test Software

1. Shipping Software

A. Prints - all on A-ML-PA68F

B. Diagnostics

a. MAINDEC-08-D2HC (Family of 8 tests for typesetting)

b. System Exerciser (two copies of customized version)

D. Test Hardware

1. Complete system as per construction requisition (or key sheet)

E. Procedure

1. Insure system assembly is complete as per construction requisition (or key sheet); i.e., all necessary I/O cables, logics, power supplies, etc.

2. With an oscilloscope check that the reader clock

SIZE	CODE	NUMBER	REV
A	SP	PA68 - F - 11	

DEC FORM NO 15 1022

II E. 2. continued
is set to exactly 2.3 msec (M401 PA68F slot B08 Pin D2). No program is needed for this check, just turn power on.

3. With an oscilloscope check that the PUNCH DONE level is at +3 volts DC for exactly 4.5 msec (M710 in PA68F slot AB07 Pin BH2) by using the following program:

```
7000 / 7040
   1   6026
   2   6021
   3   5202
   4   5200
```

Starting Address = 7000

Make sure the reader and punch are aligned correctly. Refer to the alignment procedure for the PR68B/D/DA reader and PP07 C/D punches.

NOTE: Use the customer tape for the above tests if it fails within our specs.

4. Put a full roll of paper punch tape (use same type tape as customer uses in his perforators) in the punch.

5. Load the System Exerciser, Overlay 3, into memory. With all segments of overlay three running, put the ON/OFF switch on the reader to the OFF position (push to right). The program should immediately output the following error message:

EOV3SO READER ØØØØ NO RESPONSE

Put the switch back in the ON position and the program should run normally again. Continue running all segments until the entire roll of punch tape has been expended.

6. Acceptance condition: No errors except those caused by chad, excessive dirt or damaged tape.

NOTES:

1. MODULES P1 AND P2 TO BE WIRED POINT TO POINT, ACCORDING TO WIRE TABLE
2. ASSEMBLE CLAMPS (ITEM #3) WITH EYELETS (ITEM #4) TO BOARD AFTER SOLDERING CABLE IN PLACE.
3. VARIATIONS AND LENGTHS SHOWN IN LEGEND ARE STANDARD OTHER THAN STANDARD VARIATIONS WILL BE SPECIFIED BY ALPHANUMERIC DESIGNATION FOR LENGTHS OTHER THAN FOOT INCREMENTS FROM ONE (1) FOOT THRU NINE (9) FEET, ELEVEN (11) INCHES.

   A = 1" G = 7"
   B = 2" H = 8"
   C = 3" J = 9"
   D = 4" K = 10"
   E = 5" L = 11"
   F = 6"

   EXAMPLE BC02X-3D = 3'4"
   LENGTHS WILL BE IN FOOT INCREMENTS FROM TEN (10) FEET ON AND WILL BE SPECIFIED BY THE CORRESPONDING NUMERICAL DESIGNATION
   EXAMPLE
   BC02X-11 = 11 FEET
   THE TOLERANCE ON DIMENSION "A" WILL BE ± 2% OF THE FOOT INCREMENT.
4. REMOVE EXISTING RESISTORS & REPLACE WITH ITEM #5 BUS WIRE.

DEC FORM NO. DRA 107

ENGINEERING SPECIFICATION CONTINUATION SHEET

TITLE PR68-B INSTALLATION/ADJUSTMENT PROCEDURE

PURPOSE:

The purpose of this specification is to document and standardize the installation / adjustment procedure for the new PR68-B photocell assembly. (70-09382-1)

A. INSTALLATION

I. Equipment Required

A. Field Service tool kit
B. Tektronix type 453 oscilloscope with two probes.
C. Paper glue
D. Ones and zeros test tape.
E. Field Service installation kit # 29-20672-1

II. INSTALLATION PROCEDURE

A. Removal of Previous Assembly

Remove the front faceplate which houses the amplifier logic and stepping motor from the enclosure. This is accomplished by removing the four screws around the outside perimeter of the faceplate. As the unit slides out of the enclosure, disconnect the reader cable. Next, disassemble the tape spring knob as well as the upper and lower cover boxes. Separate the amplifier logic block from the faceplate and remove the 10 solar cell wires from the pins.
Remove the old phenolic block solar assembly by removing the two #8-32 x 1½ screws securing the unit. These two machine screws are to be saved for installing the new assembly.
The tape guide shims, however, need not be saved. Disassemble the 6,8 level tape guide from the phenolic block and save both the guide and its attaching screw for future use. Check the light bulb to make sure it is rated at 12 volts, 18watts. The bulb is to be replaced if the filament shows any sign of sagging.

	SIZE	CODE	NUMBER	REV
	A	SP	PR68-B-2	

DEC FORM NO DEC 16-(381)-1022-N370 DRA 108

B. Insert each of the ten wires of the new assembly through the slot of the faceplate. The new unit attaches with the same machine screws used to mount the old assembly. Before securing the new unit in place, insure that the shrink tubing is fully forward in the slot, to prevent pinching. Connect each of the ten signal wires to the logic pins according to the table that follows. Avoid excessive flexing or tension on the wires, as they are extremely fragile and difficult at best to resolder should they break at the solar cell.

PR68B SIGNAL / WIRE TABLE

Wire Color	Reader Hole	AC Bit	Pin
* White	0	11	BN2
Grey	1	10	BM2
Violet	2	09	BL2
Blue	Feed	N/A	BD2
Green	3	08	BK2
Yellow	4	07	BJ2
Orange	5	06	BH2
Red	6	05	BF2
* Brown	7	04	BE2
Black	Ground	N/A	BC2

* Reader hole zero corresponds to the inside cell, and reader hole 7 to the outside.

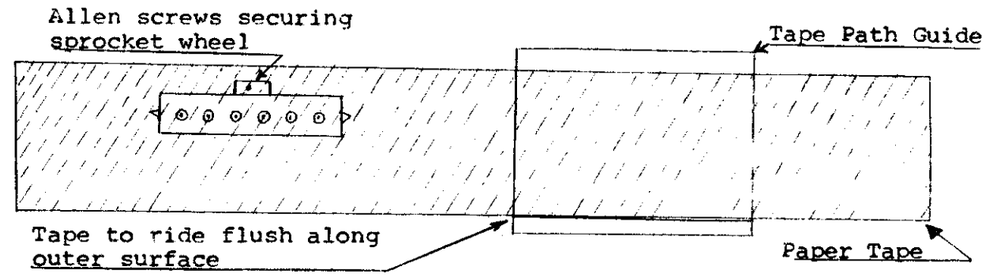
Place 3 thicknesses of tape on the tape bed and secure the tape hold down screw that connects to the backplate.

Mount the 6/8 level onto the rear of the new tape guide. Resecure the amplifier logic to the faceplate and insert the reader cable.

Apply power to the unit and attach a scope probe to the hot side of the reader light bulb. Adjust the lamp voltage to a value of 10.5 volts. In no case should a lamp voltage of less than 10.0 volts be used, as amplifier margins drop off sharply below this value. With the lamp intensity set, and with no tape in the reader, adjust the condenser lens such that the light beam falls directly on the cell. If cables are in excess of 150 feet, the -15V and ground lines must have dual wires to avoid excessive voltage drop.

Form an endless ones and zeros tape and place it into the reader. Check that the tape holes align directly over each of the solar cells.

TOP VIEW



Adjust sprocket wheel such that the tape rides smoothly along the outer surface without binding. This is accompolished by loosening the two allen screws towards the inside of the sprocket wheel. There should be no visible space between the tape and the outer ridge of the tape guide assembly.

Check to insure that there is no lateral play of the tape as it travels into the tape guide. If it is possible for the tape to be moved from the inside to the outside surface of the tape guide platform, the 6/8 level guide needs repositioning.

It is desirable that the inside fork of the 6/8 level guide keep the tape against the outside ridge of the tape guide platform. This will gaurantee smooth tracking of the tape over the solar cell holes.

Adjust the light beam such that it is projected directly over the solar cell holes. This is accompolished by first rotating the light bulb so that the glass seams do not interfere with the projected light beam.

Secondly, by rotation of the condenser lens itself care must be taken in the adjustment of the lens so as to avoid an uneven beam of light over the cells. (i.e. the beam may be narrower or wider on one end of the other.) The threaded end of the condenser lens may be filed so as to allow aligning of the lens parallel with the filament of the bulb. Once the light beam has been evenly placed over the cell holes no further adjustments of the bulb position or condenser lens is necessary.

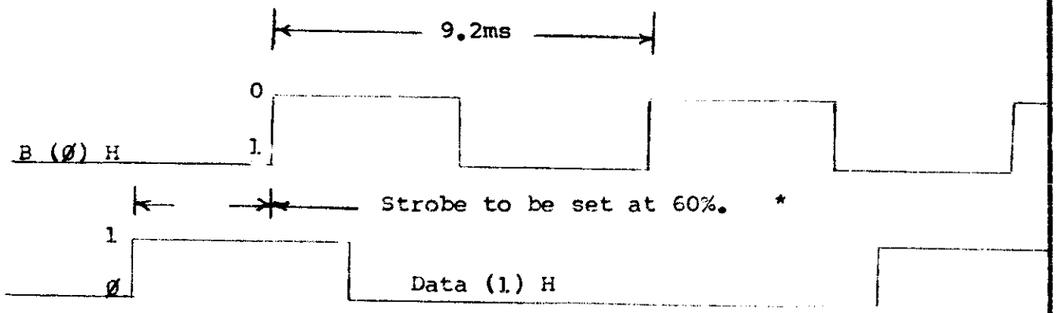
Check for the proper reader strobe by placing and endless loop tape

comprised of ones and zeros into the reader, and load the following program.

```
* 0/ 7604        Load AC from switches
* 1/ 6312        Select reader unit
  2/ 6014        Read
  3/ 6011        Skip on flag
  4/ 5003        Jmp .-1
  5/ 5002        Jmp .-2
```

* Select reader unit only applies to the PA63 controller. IOT 6312 is ignored by the PA68F.

Since step motor strobe is used in both the PA63 & PA68F, place channel 1 probe on the "B" flip flop. (B(0)H). Observe each of the data lines on channel 2 & note the one of shortest duration. (A "1" on the data lines corresponds to a +3v or high condition.) This shortest and therefore weakest of the data lines shall be used for the checking and / or setting of reader strobe. The "B" flop going to a Ø high condition, strobes the data on the lines into the reader buffer. Reading a ones and zeros tape at full speed shall yield the following scope display.



* NOTE: It is mandatory that an 8 level tape be used in the setting of reader strobe, as 6 level tapes utilize advance feed hole and 8 level tapes use center feed hole strobe.

** A detailed adjustment procedure may be found in the Typeset-8 Systems Positive Logic Maintenance Manual DEC-08-HMMPA-A-D with the exceptions noted per this specification.

III PAPER TAPE REQUIREMENTS

The characteristics of the tape used in the PR68B affect the data reliability of the unit. Avoid changes in tape color and extreme changes in translucency. Both properties affect the sensitivity adjustments of the G908 amplifier. A recommended table of paper tape specifications follows.

PAPER TAPE SPECIFICATIONS

PROPERTY	SPECIFICATION	CHARACTERISTIC
Oil Content	6% minimum 1.2% maximum	Uniformly impregnated with a lightly refined parafin base, light grade lubricating oil, light in color.
Translucence	32% to 38% maximum	Maximum transmission of incident light through the paper, limited by combined oil content & paper opacity.
General Quality	Standard grade containing less than 1% ash & grit.

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PR68D & PR68DA Engineering Specifications

SCOPE

The PR68D & DA are paper tape readers. They must be used with either a PA68F or PA63 controller. They interface to these controllers with a BCØ1H cable. They will read at a rate of 110 cps. They are designed to read both 6 & 8 level paper tape.

I. General Specifications

A. Mechanical: Dimensions: 7¼" X 11" X8½"
Weight: 4½ lb. (approx.)

B. Environmental: Maximum ambient temperature 50°C.

C. Electrical: +5v @ 300ma (approx.)
-15v @ 700-800ma
+30v @ amp running, 1 amp selected and idle.

D. Paper tape specifications

(Translucence 32-38%, Oil content 5-8%, Ash 100% max, Grit .04max, and color consistant).

II. Reader Signals

Pin	Signal	Description
P1,B2	-15v	Supplies current to reader amplifiers and bulbs.
R1		Must not be used.
A2	+5v	Supplies current to all logic components.
S1,U1,U2	+30v	Supplies current to drive stepping motor.
V1	Sel Rdr H	When signal is asserted, reader is enabled by rocker switch.
C2	GND	
T1	Return	Return path for current generated from -15v source.
D2	RD Hole Ø H	Signal is asserted when a hole is detected.
E2	RD Hole 1 H	Signal is asserted when a hole is detected.
F2	RD Hole 2 H	Signal is asserted when a hole is detected.
H2	Out of tape H	Signal is asserted when a hole is detected. Used to detect out of tape.

SIZE	CODE	NUMBER	REV
A	SP	PR68-D-6	C

DEC FORM NO DEC 16-(381)-1022-N370
DRA 108

II. Reader Signals Continued

J2	RD Hole 3 H	Signal is asserted when a hole is detected.
K2	RD Hole 4 H	Signal is asserted when a hole is detected.
L2	RD Hole 5 H	Signal is asserted when a hole is detected.
M2	RD Hole 6 H	Signal is asserted when a hole is detected.
N2	RD Hole 7 H	Signal is asserted when a hole is detected.
T2	SDB(Ø)L	+30v to GND. Used to increment motor.
S2	SDB(1)L	+30v to GND. Used to increment motor.
R2	SDA(Ø)L	+30v to GND. Used to increment motor.
P2	SDA(1)L	+30v to GND. Used to increment motor.
V2	NTTA	When signal is at GND, it places the readers in the non-torn tape allotment mode.

III. Alignment Procedure and Control Settings:

A. Tape Guide: The tape guide opening should be centered over the photo cells, making sure it does not block the light path. There should be a gap* between the tape guide and the paper tape.
*The gap should be approximately 3 thicknesses of the paper tape.

B. Light Bulb: Select bulbs with reasonably straight and uniform filaments. Position the bulb with the engraved end toward the Reader. There are two seams on the bulb which must be kept out of the light path.

C. Lamp Voltage: Set the adjustable power resistor in the lamp circuit for -5.8v. The bulbs' intensity and the output of the photocells may vary from one unit to the next, so that this resistor may have to be varied to compensate.

D. 6-8 Level Slide: This slide should be [illegible] reading 6 level paper tape and lowered for 8 level tape.

III. Continued

E. Sprocket Wheel: Lateral and rotational adjustment of the sprocket wheel provides clearance [illegible] paper tape and centers the data holes over the proper [illegible] cell apertures. Adjust the wheel in the following manner:

With the power on and the reader [illegible] place an 8 level, 1's & 0's tape [illegible] Loosen the two set screws and lower the [illegible] arm. Position the center of the data [illegible] to LEFT of that portion of the photo cell [illegible] by a glass dot.

Next, insert a 6 level 1's & 0's tape [illegible] reader. The center of the data holes should fall just to the RIGHT of the photo cell centers. (See Figure 1.).

Due to some misalignment in the photo cells themselves, the above alignment of the data holes to photo cells may have to be varied slightly. Retighten the set screws.

F. Lens and Light Arrangement:

With power on and the reader selected, pleace an 8 level tape into the reader with the data holes properly centered over the photo cells. Project the forward edge of the light band along the leading edge of the data holes by rotation of the bulb (or tilting of the lens if necessary). The lens should project a narrow light beam, but one that is wide enough to completely encompass the data holes. (See Figure 1). The bulb contains two seams which should be kept [illegible] light path.

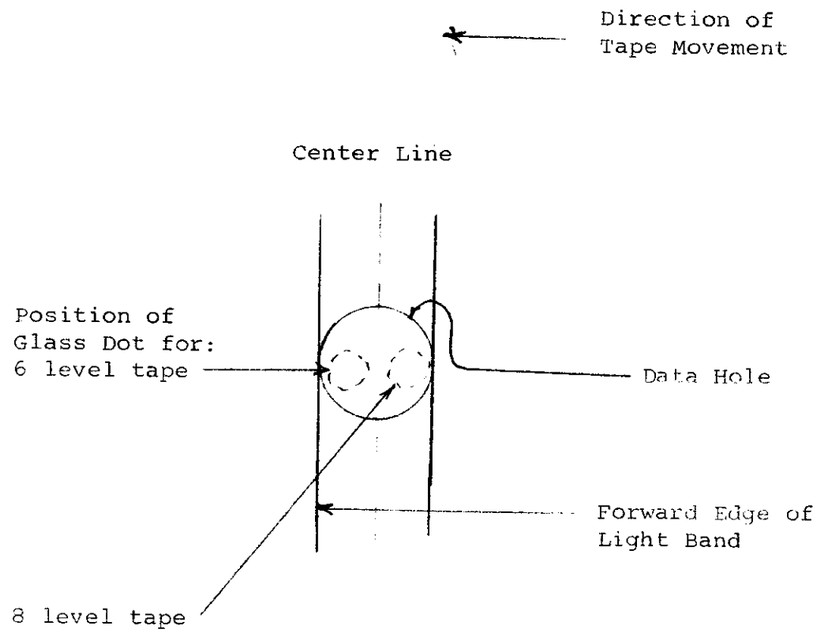

FIG 1

G. G918 Amplifier Adjust: Load [illegible]-Ø8-D2HC-PB into MEM (via TTY not reader), select program 1Ø using 1's & 0's loop. The object of this test is to select the margins between which the reader reads without error and then reset the pot to a point midway between the upper and lower margins. To do this, start the program and if the reader is running errorless, turn the pot until an error occurs: reverse direction of the pot until the next error occurs (keeping track of amount of turns between errors) and then reset the pot midway between these errors. (If at the start of the program the reader does not read, adjust the pot in one direction until an error occurs and use this point as one of the margins.) In either case a minimum of 10 turns is required. This is only a preliminary setting.

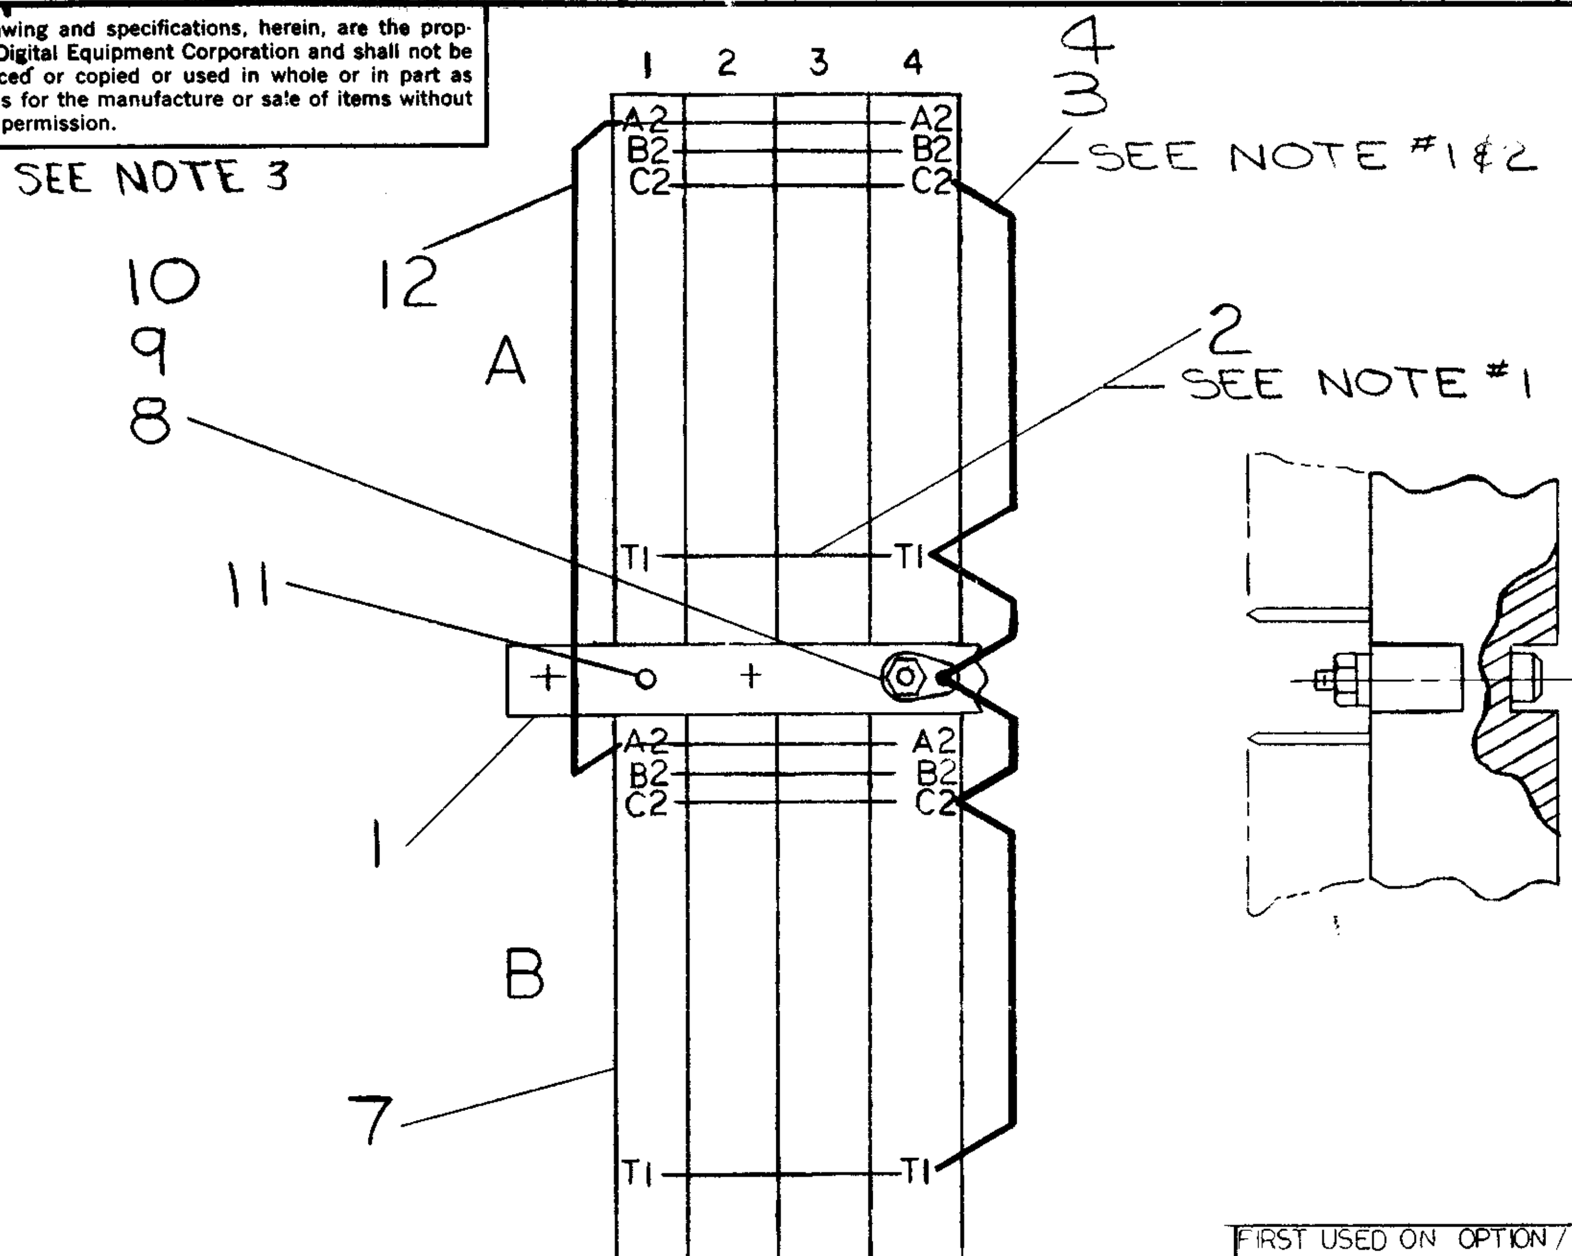
Repeat the above test for prog. Ø2 and then Ø7, using a binary count loop. In these tests keep SR's Ø3 and Ø6 = 1 while adjusting pot. Not less than 10 turns is accepted. After setting the adjustment pot to its direct center, turn it 1½ turns in the clockwise direction. (This is to allow for heating of the photo cell circuitry).

H. NTTA RDR Select Switch (PA63 only)

Put the following Rdr select and read program into loc. 7Ø2Ø.

```
7Ø2Ø    76Ø4      START   SR Settings
        6312              NONE = Rdr ØØ
        73ØØ              SR11 = Rdr Ø1
        6Ø16              SR1Ø = Rdr Ø2
        6Ø11              SR1Ø,11 etc. = Rdr Ø3
        5224
        522Ø
```

With a tape loop in reader, put SRØ to 11 = Ø and start program. The NTTA lamp in reader ØØ should be lit and the reader should not be selected. Depress NTTA switch. The NTTA lamp should turn off and the reader should select. By putting any other SR to A 1, the lamp should turn on in reader ØØ and it should de-select.



NOTES:

1. CONNECTIONS ON ITEMS 2 & 3 TO BE SOLDERED & LOCATED AT MINMUM PRACTICAL HEIGHT ABOVE BLOCKS.
2. CONNECTOR BLOCK TO BE GROUNDED TO GROUND LUG AS SHOWN.
3. USE YELLOW WIRE (ITEM #5) FOR MACHINE WRAPPED & BLUE WIRE (ITEM #6) FOR ALL HAND WRAPPED WIRE EXCEPT WIRE FROM AØ1A2 TO BØ1A2. THIS SHOULD BE HAND WRAPPED WITH RED WIRE (ITEM 12)
4. D664 DIODE FROM BØ4J2 TO BØ4T1. CATHODE AT BØ4J2.

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PR68D & PR68DA MANUFACTURING TEST PROCEDURE

1.Ø EQUIPMENT

1.1 PDP8L, PDP8E, PDP8I (positive bus)
1.2 Teletype
1.3 453 scope and voltage probes
1.4 PA63 of PA68F reader, punch control
1.5 PP67-D BRPE punch
1.6 Reader cable BC01H-Ø-Ø
1.7 Punch cable BC01F-Ø-Ø
1.8 External power supplies (798) (H7xx)

2.Ø TEST STATION SET UP

2.1 Set up PA63 or PA68F to computer as shown in respective test station set up procedure.
2.2 Connect reader to reader-punch control. For PA63 plug cable into slot D36. For PA68F plug reader cable into slot B16.
2.3 Turn power on.

3.Ø ALIGNMENT PROCEDURE AND CONTROL SETTINGS

3.1 Tape hold down bracket: the tape hold down bracket opening should be centered over the photocells, making sure it does not block the light path. There should be a minimum gap between the tape hold down bracket and the paper tape, approximately 3 thicknesses of paper tape.
3.2 Light bulb: select bulbs with reasonably straight and uniform filaments. Position the bulb with the engraved end toward the reader. There are two seams on the bulb which must be kept out of the light path.
3.3 Lamp Voltage: set the adjustable power resistor in the lamp circuit for -5.8v. The bulbs intensity and the output of the photocells may vary [illegible] next, so that this resistor may have to be varied to compensate.
3.4 6-8 level slide: this slide should be raised when reading 5 level paper tape and lowered for 8 level tape.

SIZE	CODE	NUMBER	REV
A	SP	PR68-D-8	C

3.5 Sprocket Wheel: this adjustment can be made with or without the use of a scope.

3.5.1 Without scope: Lateral and rotational adjustment of the sprocket wheel provides clearance for the paper tape and centers the data holes over the proper photocell apertures. Adjust the wheel in the following manner:

With power on and the reader selected, place 8 level 1's and 0's tape in the reader.

Loosen the two set screws in the sprocket wheel and lower the tape holding arm. Position the center of the data holes just to the left of that portion of the photocell indicated by a glass dot. This can be set by moving the sprocket either backwards or forwards on the motor shaft. Next, insert a 6 level 1's and 0's tape in the reader. The center of the data holes should fall just to the right of the photocell centers. (See figure number 1).

Due to some misalignment in the photocells themselves, the above alignment of the data holes to photocells may have to be varied slightly.

Retighten the set screws on the sprocket wheel and recheck alignment conditions.

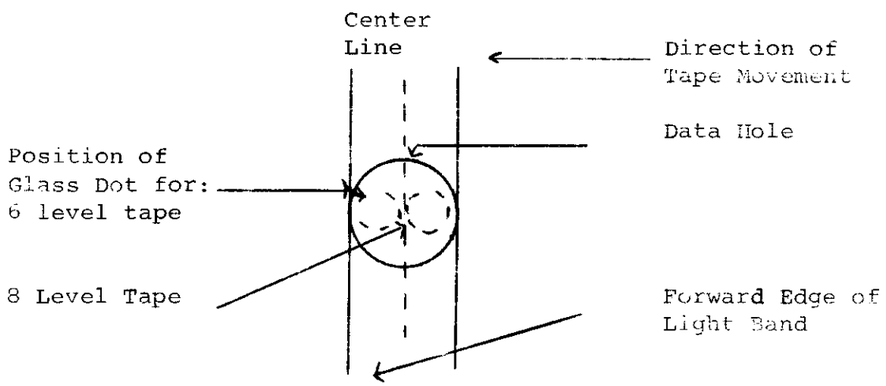

FIG. 1

3. .2

3.5.2 With scope: with the use of a model 453 scope and voltage probes, set the scope as follows:

a. set channel 1 to 1.0 volts per CM
b. set channel 2 to .2 volts per CM
c. set time to .2 ms per CM
d. put channel 1 probe on AØ4T2 (+30 strobe) of the reader logic.
e. put channel 2 probe on AØ4D2 (reader hole 0) of the reader logic.

Put 1's and 0's paper tape loop in reader and put the following reader read program into location 7000 of the computer.

```
7000/7300
    /6016
    /6011
    /5202
    /5200
```

Load and start 7000. If there is no data signal when the program is started, turn pot on G918 until a data pulse should coincide with strobe such that the positive portion of the data pulse should be centered on the negative portion of the strobe. (See figure 2). If waveform is not correct, sprocket wheel is not aligned. Stop machine, loosen sprocket wheel and move until proper position is found. Reference 3.5.1. Align sprocket wheel until this condition is obtained.

3.6 G918 Amplifier Adjust: Load MAINDEC* into memory (via TTY---not reader). Select program**, using 1's and 0's loop. The object of this test is to select the margins between which the reader reads without error and then reset the pot to a point midway between the upper and lower margins. To do this, start the program and if the reader is running errorless, turn the pot until an error occurs. Reverse direction of the pot until the next error occurs (keeping track of amount of turns between errors) and then reset the pot midway between these errors. If at the start of the program the reader does not read, adjust the pot in one direction until an error occurs and use this point as one of the margins. In either case a minimum 10 turns is required. This is only a preliminary setting.

* MAINDEC-Ø8-D2HC-PB ** PGM 10

Repeat the above test for program 02 and then 07, using a binary count loop. In these tests keep SR's 02 and 06 - 1 while adjusting pot. Not less than 10 turns is acceptable. After setting the adjustment pot to its direct center, turn it 1½ turns in the clockwise direction. This is to allow for heating of the photocell circuitry.

3.7 On line heat test: 50°C/120°F for 30 minutes. Run MAINDEC-08-D2HC-PB tests 2, 7 and 10.

4.Ø NTTA READER SELECT SWITCH (PA63 only)

4.1 Put the following reader select and read program into location 7020.

```
7020/7604       START            SR Settings
     6312            NONE = Rdr ØØ
     7300            SR11 = Rdr Ø1
     6016            SR1Ø = Rdr Ø2
     6011          SR1Ø,11 = Rdr Ø3 etc.
     5224
     5220
```

With a tape loop in reader, pur SRØ to SR11 = Ø load add and start at 7020. The NTTA lamp in reader ØØ should be lit and the reader should not be selected, depress NTTA switch. The NTTA lamp should turn off and the reader should select. By putting any other SR to A 1, the lamp should turn on in reader ØØ and it should de-select.

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PR68-D ACCEPTANCE CRITERIA

SCOPE

To define the criteria necessary to accept for shipment the positive bus PR68D typesetting 6 or 8 level paper tape reader.

TEST SOFTWARE

Program - MAINDEC-Ø8-D2HC-PB
Prints - See master list PR68D
Paper tape - Yellow oiled Part # 36-10730-1 (6 level)
36-10730-2 (8 level)

TEST HARDWARE

Computer - Positive bus PDP-8/L or PDP-8/I
Controller - PA63
Punch - PP67D

PROCEDURE

1. Complete standard option check list.
2. Run MAINDEC-Ø8-D2HC-PB. Using 6 level tape, as follows-
   Test 5 - full speed (SR6=1) 5 minutes
   Test 6 - full speed (SR6=1) 10 minutes
   Test 7 - full speed (SR6=1) 20 minutes
3. Repeat using 8 level tape

NOTE - No errors allowed except those caused by dirt, chad, or knotted tape.

SHIPPING SOFTWARE

MAINDEC-Ø8-D2HC-PB
Prints - All prints listed on PR68D master list.
Also see accessory list.

SHIPPING HARDWARE

1. BCØ1H-Ø-Ø cable per reader.

* LETTER DESIGNATION "A" INDICATES WIRE IS TO BE SOLDERED.

** ALL ITEMS IN THE "FROM" COLUMN HAVE BEEN PRE ASSEMBLED (SOLDERED) ON ASSY # D-AD-7006385-0-0 SH #2. THE ONLY CONNECTIONS THAT HAVE TO BE MADE ARE LISTED IN "TO" COLUMN AND "EQUIP TO WITH ITEM" COLUMN.

1. NOTE: REMOVE WHT WIRE FROM T2-A TO J1-18 ON PURCHASED PUNCH BRPE-18.
2. NOTE POLARITY OF DIODE ON T2.
3. NOTE: CONNECTOR J1, PINS 10, 14, 15, 16, 18 & 19 ARE BUSSED TOGETHER USING AWG #22 WIRE.
4. NOTE: REMOVE YELLOW WIRE FROM J1-21 TO CENTER ARM OF OUT-OF-TAPE SWITCH OF PURCHASED PUNCH, AND RERUN THIS WIRE FROM CENTER ARM OF OUT-OF-TAPE SWITCH TO S1-J.
5. NOTE: J1, P1, T1, T2, TS1 COMPONENTS ARE LOCATED ON PUNCH ASS'Y (BRPE)
6. NOTE: ALL WIRES GOING TO J1 AMPHENOL PLUG SHOULD HAVE INSULATORS WHEREVER POSSIBLE.
7. NOTE: REPLACE NINE (9) DIODES ON BOTTOM OF ALL BRPE PUNCHES USED FOR POSITIVE LOGIC (PP67C & D) WITH IN91 DIODES. PART # 1101515. THE IN91'S ARE MOUNTED IN THE REVERSE POLARITY OF ORIGINAL PURCHASED ARRANGMENT.

SHEET 1

ENGINEERING SPECIFICATION [redacted] CONTINUATION SHEET

TITLE PP67 C/D ADJUSTMENT PROCEDURE

I. Punch Mechanism Adjustment

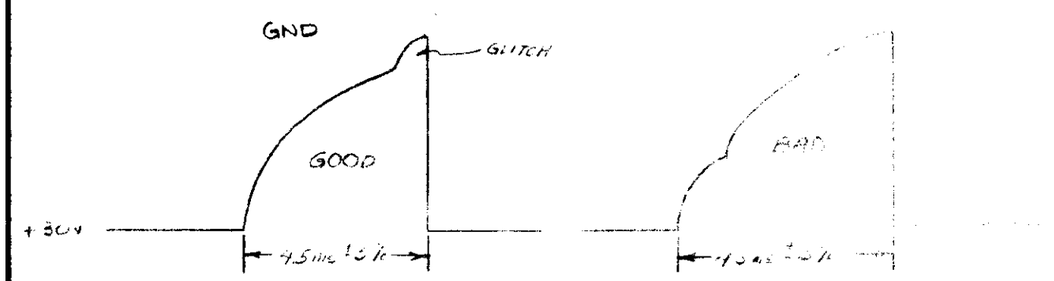
All mechanical adjustments for the punch are detailed in the BRPE Technical Manual. When it is believed that the punch mechanism is the cause of incorrect data being punched, the following procedure should be employed for best results.

1. Load the following program into LOC. 7000

```
7000)   7604          SR = 7000
        6314          LOAD  ADD
        7300          SR8-11 = Punch N°

        7040
        6026          START
        6021
        5205
        5203
```

2. Check each solenoid by securing a scope probe on the tab which is being fed by the solenoid driver (usually the solid color wire). The probe should be connected to channel 2 of the scope with the INVERTER switch pulled out.



SIZE	CODE	NUMBER	REV
A	SP	PP67-C-4	

DEC FORM NO 16-1222 DRA 108

The "glitch" should be positioned at the trailing edge of the sawtooth waveform (see above). This can be achieved by slackening the two screws which clamp the punch solenoid, and adjusting the solenoid until the "glitch" is in the correct position. Make sure that when making this adjustment, the solenoid is moved squarely in the vertical direction. If tilted, the armature may slip out of the blocking pawl.

3. To check the feed hole solenoid, the program will have to contain a stall so that the solenoid is de-energized between punching of characters. The following program would be suitable for running while checking all solenoids:

```
2ØØ/76Ø4        SR = Ø2ØØ
    6314         LOAD ADD
    72ØØ         SR8-11 = Punch N°
    6Ø26         START
    6Ø21
    52Ø4
    222Ø
    52Ø6
    7Ø4Ø
    52Ø3
```

Use the same method as described in Part 2 for adjusting this solenoid.

4. Punching alternate 1's and Ø's, slacken the screw holding the range finder and move the slide in one direction until punching begins to deteriorate: Note the position on the scale, them move the slide in the opposite direction until punching begins to deteriorate again and note the position on the slide. Set the range-finder at the midway point between the two positions and tighten the screw. If no punching errors occur using the above method then set the range finder at 30°.

II. Low Tape Adjustment

To adjust the Low Tape Indicator Arm, load the following program to select the particular punch you are adjusting.

```
                 SR = 7ØØØ
7ØØØ  /  76Ø4    LOAD ADD
         6314    SR8-11 = Punch N°
         74Ø2    START
```

Place the tape spool, with the amount of tape* considered to be a low tape condition, in the punch. Loosen the two screws which fasten the low tape switch; move the switch until the Low Tape light on the PA63 indicator panel just turns on. At this point the left and center contacts on the switch should just be breaking contact. Tighten the screws and check that the light remains on. Now lift the arm until the light goes out. There should be no more than 1/16" between the tape and the arm; if there is, readjust the switch until these conditions are met.

With the arm in the low tape condition, run the program from the following section. It should halt in location 7Ø04. With the arm not in the low tape condition, restart the program. The punch should start up and punch.

* There should be about 3/8" of paper tape left on the core.

III. Availability Switch Checkout

To checkout the switch, which is on the top of the punch, load the following program into core:

```
7ØØØ   /   76Ø4          SR = 7ØØØ
           6314          LOAD ADD
           6311          SR8-11 = Punch N°
           52Ø5          START
           74Ø2
           6Ø26
           6Ø21
           52Ø6
           52Ø5
```

Available Mode: Place the switch in this position and make sure that there is not a low tape condition. Run the above program; the punch should start up and punch.

Stop When Done Mode: Run the above program with the punch in the Available Mode. When the punch starts punching, turn the switch to the Stop When Done mode; the punch should continue punching as if nothing has changed.

Stop the program with the switch in the Stop When Done mode and restart the program. The program should halt in location 7ØØ4.

Continuous Mode: Place the switch in this position. The punch motor should start immediately. Start the above program; it should halt in location 7ØØ4.

Off Mode: With the switch in this position, start the above program. The program should halt at location 7ØØ4.

The "Glitch" should be positioned at the trailing edge of the sawtooth waveform (see above). This can be achieved by slackening the two screws which clamp the punch solenoid, and adjusting the solenoid until the "glitch" is in the correct position. Make sure that when making this adjustment, the solenoid is moved squarely in the vertical direction. If tilted, the armature may slip out of the blocking pawl.

3. To check the feed hole solenoid, the program will have to contain a stall so that the solenoid is de-energized between punching of characters. The following program would be suitable for running while checking all solenoids:

```
2000)          CLR % Ø              SR = 2000
        CLR/   CLR % 1              LOAD ADD
        CMP/   CMP % Ø              START
               MOV % Ø, @ # PPB
        TST/   TST B @ # PPS
               BPL TST
        INC/   INC % 1
               TST % 1
               BPL INC
               JMP @ # CLR
```

Use the same method as described in Part 2 for adjusting this solenoid.

4. Punching alternate 1's and Ø's, slacken the screw holding the range finder and move the slide in one direction until punching begins to deteriorate: Note the position on the scale, then move the slide in the opposite direction until punching begins to deteriorate again and note the position on the slide. Set the range finder at the midway point between the two positions and tighten the screw. If no punching errors occur using the above method then set the range finder at 30^{o}.

II. LOW TAPE ADJUSTMENT

To adjust the Low Tape Indicator Arm, load the following program:

```
7000)   START/  TST @ # PPS            SR = 7000
                BPL   START            LOAD ADD
                MOV # 000, @ # TPB     START
          TST/  TST B @ # TPS
                BPL TST
                JMP @ # START
```

Place the tape spool, with the amount of tape* considered to be a low tape condition, in the punch. Loosen the two screws which fasten the low tape switch; move the switch until the teletype responds. At this point the left and center contacts on the switch should just be breaking contact. Tighten the screws and check that the teletype is still responding. Now lift the arm until the teletype stops. There should be no more than 1/16" between the tape and the arm; if there is, re-adjust the switch until these conditions are met.

* There should be about 3/8" of paper tape left on the core.

III. AVAILABILITY SWITCH CHECKOUT

To checkout the switch, which is on the top of the punch, use the program from the previous section. Load and start at 7000.

Available Mode: Place the switch in this position and make sure that there is not a low tape condition. Run the above program, the teletype should do nothing.

Stop When Done Mode: While the program is running, move the switch from the Available Mode; the teletype should respond.

Continuous Mode: Place the switch in this position. The punch motor should start immediately. Start the above program; the teletype should respond.

Off Mode: With the switch in this position, and the program running, the teletype should respond.

SHEET 1 OF 4

ENGINEERING SPECIFICATION — CONTINUATION SHEET

TITLE PP67C/D ACCEPTANCE CRITERIA

SCOPE

To define the criteria necessary to accept, for shipment, the PP67C (6 level) and PP67D (8 level) Typesetting Paper Tape Punch.

NOTE: Paper Tape Part numbers are as follows:

Yellow Oiled Tape (6 level) - 36-10730-1
Yellow Oiled Tape (8 level) - 36-10730-2

TEST HARDWARE

Option 1: PDP-11 Family Computer with PA611C Controller and PR68E paper tape reader or

Option 2: PDP-8 Family Positive Bus Computer with PA63 Controller PD68D; 6 or 8 level Typesetting Paper Tape Reader.

TEST SOFTWARE

Option 1: MAINDEC-11-DZPAAA-PB
Option 2: MAINDEC-08-D2HC-PB
Prints: All prints on ML-PP67C
One roll of 6 or 8 level yellow, oiled tape; level will depend on punch.

PROCEDURE

1. Complete standard option check list.
2. Inspect punch for good workmanship, namely the punch amphenol connectors and the damping diodes mounted underneath the punch.
3. Option 1
   a. Load the punch with a tape roll containing about 1/2" thickness of tape left on the core.
   b. Load the following program:

```
000200 / 005737     202/172700     TST # PPS
  204 / 100775                    BMI .-4
  206 / 000000                    HALT
```

	A	SP	PP67-C-5	B

DEC FORM NO DEC 16-(381)-1022-N370
DRA 108

SHEET 2 OF 4

PROCEDURE (continued)

3. c. Connect the punch to punch Ø slot of the PA611-P (FØ1).

d. Turn the 4 position switch on the punch to "OFF".

e. Start the program at ØØØ2ØØ. The program should run continuously. If it halts, there is an error.

f. Turn the 4 position switch to "CONTINUOUS", then "STOP WHEN DONE". The program should continue to run. Then turn the switch to "AVAILABLE"; the program should halt. If it does not, there is an error.

g. Load the punch with a tape roll containing about 3/8" thickness of tape left on the core. Start the program again; it should not halt. If it does, adjust the "OUT OF TAPE" micro switch on the punch until the program runs continuously.

h. Load the punch with a full roll of yellow tape. Load in MAINDEC-11-DZPAA-PB and run program 1 for one full roll of tape. Check the registration periodically to ensure there are exactly ten holes/inch. Verify the tape punched, using program 2.

4. Option 2

a. Load the following program:

```
7ØØØ/   7ØØ1
   1/   6311
   2/   5204
   3/   5200
   4/   6026
   5/   6021
   6/   5205
   7/   5200
```

b. Connect the punch to channel Ø (C36) of the PA63.

c. Turn the 4 position switch on the punch to "OFF".

d. Start the program at 7000. The program should show the AC being indexed, meaning the punch is not available. If tape is punched, there is an error. Turn the function selector to "CONTINUOUS" and "STOP WHEN DONE". The indications should be the same.

PROCEDURE (continued)

4. e. Load the punch with a tape roll containing about 1/2" thickness of tape left on the core. Turn the switch to "AVAILABLE" and a binary count pattern should be produced.

f. Remove the 1/2" tape roll and replace it with a roll containing about 3/8" of tape left on the core. This should bring about the not available condition (out of tape).

g. Load the punch with a full roll of yellow tape.

h. Load MAINDEC-08-D2HC-PB and start program #5. Let run as follows:

1) SR6 = 0 5 minutes
2) SR6 = 1 10 minutes
3) SR6 = 0 and 1 alternately - 10 minutes

Verify tape punches with Test Ø6 after each mode (after 1) then 2), then 3) to alleviate the impracticability of having 25 minutes tape piled up. Also periodically check the registration to ensure there are exactly ten holes/inch.

SHIPPING HARDWARE

1. Power Cord for punch (6 feet) DEC-7ØØ524Ø.

SHIPPING SOFTWARE

As in Test Software, but see Note below:

NOTE: Punch acceptance on a customers system is to be performed in conjunction with PA611, PA63 or PA68F acceptance. It is covered in the respective acceptance procedures. If punch to be shipped is part of a system, paper tape to be shipped will be covered in the respective Acceptance Procedure.
