5. Strobe Timing:

6. Strobe Polarity:

The keyboard is shipped wired for a positive strobe. To modify

for a negative strobe, cut the trace from "+" to the center pad and install a jumper from the center pad to "-", as shown below.

BOTTOM OF BOARD SHOWN

7. "CAPS LOCK" key, shifts all letter keys to upper case and unshifts the following keys: @ [/] ^

No other keys are affected.

8. An underline may be generated by the Shift-Del combination.
9. If a key is depressed for more than 1-1.5 seconds, the character will be repeated 3-5 times per second until released.
10. The four function keys (top row of numeric pad) are enclosed as listed below:

I	FS
II	GS
III	US
IV	RS

11. All hexboard characters generate the corresponding ASCII codes which are defined in the following 3 pages.

USA Standard Code for Information Interchange

1. Scope

This coded character set is to be used for the general interchange of information among information processing systems, communication systems, and associated equipment.

²The use of the symbols in 2/2, 2/7, 2/12, 5/14, 6/0, and 7/14 as diacritical marks is described in Appendix A, A5.2.

³These characters should not be used in international interchange without determining that there is agreement between sender and recipient. (See Appendix B4.)

⁴In applications where there is no requirement for the symbol #, the symbol & may be used in position 2/3.

3. Character Representation and Code Identification

The standard 7-bit character representation, with b_7 the high-order bit and b_1 the low-order bit, is shown below:

EXAMPLE: The bit representation for the character "K," positioned in column 4, row 11, is

b_7	b_6	b_5	b_4	b_3	b_2	b_1
1	0	0	1	0	1	1

The code table position for the character "K" may also be represented by the notation "column 4, row 11" or alternatively as "4/11." The decimal equivalent of the binary number formed by bits b_7 , b_6 , and b_5 , collectively, forms the column number, and the decimal equivalent of the binary number formed by bits b_4 , b_3 , b_2 , and b_1 , collectively, forms the row number.

The standard code may be identified by the use of the notation ASCII or USASCII.

The notation ASCII (pronounced as'-key) or USASCII (pronounced you-sas'-key) should ordinarily be taken to mean the code prescribed by the latest issue of the standard. To explicitly designate a particular (perhaps prior) issue, the last two digits of the year of issue may be appended, as, "ASCII 63" or "USASCII 63".
