

Micropolis Disk Images (56K)

Bootable on a Vector Graphic MZ in the 56K Configuration

(Not all version of CP/M use the console device present in the ROM Monitor. If a version does not seem to be booting, connect a serial terminal to Bitstreamer II Port A and see if console I/O is present there)

Note: This disk performs console I/O directly through the serial port independent of the ROM Monitor console device. To use the console device present in the ROM Monitor (e.g., Flashwriter and keyboard), use "DDT CONFIG.COM" and change location 0120h to 084h (Vector MZ configuration code). Exit DDT, then SAVE 24 CONFIG.COM. Upon cold start, the driver change is loaded into memory and you are prompted to make the change permanent with "SAVEUSER" if desired. This disk also has many files set to read only. Fix this with: A>STAT *.* \$R/W. The disk image CPM22B-Lifeboat.VGI has these fixes in place along with a few additional files.
